

# Chapter 6

## The Link Layer and LANs

---

Slides adopted from original ones  
provided by the textbook authors.

## *Computer Networking: A Top Down Approach*

7<sup>th</sup> edition

Jim Kurose, Keith Ross

Pearson/Addison Wesley

April 2016

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Link layer services

- ❖ *framing*
- ❖ *link access*
- ❖ *error detection and correction*

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Parity checking

## *single bit parity:*

- ❖ detect single bit errors

## *two-dimensional bit parity:*

- ❖ detect and correct single bit errors

Even parity: parity bit chosen for even # of 1s

Odd parity: parity bit chose for odd # of 1s

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

*no errors*

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

parity error

*correctable  
single bit error*

# CRC example

want:

$$D \cdot 2^r \text{ XOR } R = nG$$

*equivalently:*

$$D \cdot 2^r = nG \text{ XOR } R$$

*equivalently:*

if we divide  $D \cdot 2^r$  by  $G$ , want remainder  $R$  to satisfy:

$$R = \text{remainder}\left[\frac{D \cdot 2^r}{G}\right]$$

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Summary of MAC protocols

- ❖ *channel partitioning*, by time, frequency
  - Time Division Multiple Access
  - Frequency Division Multiple Access
- ❖ *random access* (dynamic),
  - ALOHA, S-ALOHA
  - carrier sensing: easy in some technologies (wire), hard in others (wireless)
  - CSMA/CD used in Ethernet
- ❖ *taking turns*
  - polling from central site used in Bluetooth
  - token passing used in fiber optical, token ring

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# ARP: mapping IP to MAC

- ❖ A wants to send datagram to B
  - B's MAC address not in A's ARP table.
- ❖ A **broadcasts** ARP query packet, containing B's IP address
  - dest MAC address = FF-FF-FF-FF-FF-FF
  - all nodes on LAN receive ARP query
- ❖ B receives ARP packet, replies to A with its (B's) MAC address
  - frame sent to A's MAC address (unicast)
- ❖ A caches (saves) IP-to-MAC address pair in its ARP table until information becomes old (times out)
  - soft state: information that times out (goes away) unless refreshed
- ❖ ARP is “plug-and-play”:
  - nodes create their ARP tables *without intervention from net administrator*

# Addressing: routing to another LAN

- ❖ Destination IP in another LAN
  - Destination MAC is that of first hop router interface (aka default gateway)
- ❖ Destination IP in same LAN
  - Destination MAC is that of destination host

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

## 6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Ethernet: physical topology

- ❖ **bus**: popular through mid 90s
  - all nodes in same collision domain (can collide with each other)
- ❖ **star**: prevails today
  - active **switch** in center
  - each “spoke” runs a (separate) Ethernet protocol (nodes do not collide with each other)

**bus**: coaxial cable

# Ethernet

- ❖ frame structure: sending adapter encapsulates IP datagram (or other network layer protocol packet) in **Ethernet frame**

- ❖ features:
  - *Connectionless*
  - *Unreliable*
  - MAC protocol: unslotted *CSMA/CD with binary backoff*

# Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,  
correction

6.3 multiple access  
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:  
MPLS

6.6 data center  
networking

6.7 a day in the life of a  
web request

# Ethernet switch

- ❖ *link-layer device: takes an active role*
  - store, forward Ethernet frames
  - examine incoming frame's MAC address, *selectively* forward frame to one-or-more outgoing links when frame is to be forwarded on segment, uses CSMA/CD to access segment
- ❖ *transparent*
  - hosts are unaware of presence of switches
- ❖ *plug-and-play, self-learning*
  - switches do not need to be configured

# Switch: self-learning

- ❖ switch learns which hosts can be reached through which interfaces
  - when frame received, switch “learns” location of sender
  - records sender/location pair in switch table
- ❖ forwarding packet
  - frame destination unknown: flood
  - destination location known: selective send

# VLANs: motivation

## ❖ Motivation

- Lack of traffic isolation
- Inefficient use of switches
- Managing users

## ❖ Virtual Local Area

- Switch(es) supporting VLAN capabilities can be configured to define multiple virtual LANS over single physical LAN infrastructure.
- *trunk port*: carries frames between VLANS defined over multiple physical switches via the 802.1q protocol

# Chapter 8

## Security

Slides adopted from original ones  
provided by the textbook authors.

## *Computer Networking: A Top Down Approach*

7<sup>th</sup> edition

Jim Kurose, Keith Ross

Pearson/Addison Wesley

April 2016

# Chapter 8: Network Security

## *Chapter goals:*

- understand principles of network security:
  - cryptography and its *many* uses beyond “confidentiality”
  - authentication
  - message integrity
- security in practice:
  - firewalls and intrusion detection systems
  - security in application, transport, network, link layers

# Chapter 8 roadmap

*8.1 What is network security?*

8.2 Principles of cryptography

8.3 Message integrity, authentication

8.4 Securing e-mail

8.5 Securing TCP connections: SSL

8.6 Network layer security: IPsec

8.7 Securing wireless LANs

8.8 Operational security: firewalls and IDS

# What is network security?

*confidentiality*: only sender, intended receiver should  
“understand” message contents

# What is network security?

*confidentiality*: only sender, intended receiver should  
“understand” message contents

*authentication*: sender, receiver want to confirm identity of  
each other

# What is network security?

*confidentiality*: only sender, intended receiver should  
“understand” message contents

*authentication*: sender, receiver want to confirm identity of  
each other

*message integrity*: sender, receiver want to ensure message  
not altered (in transit, or afterwards) without detection

# What is network security?

*confidentiality*: only sender, intended receiver should  
“understand” message contents

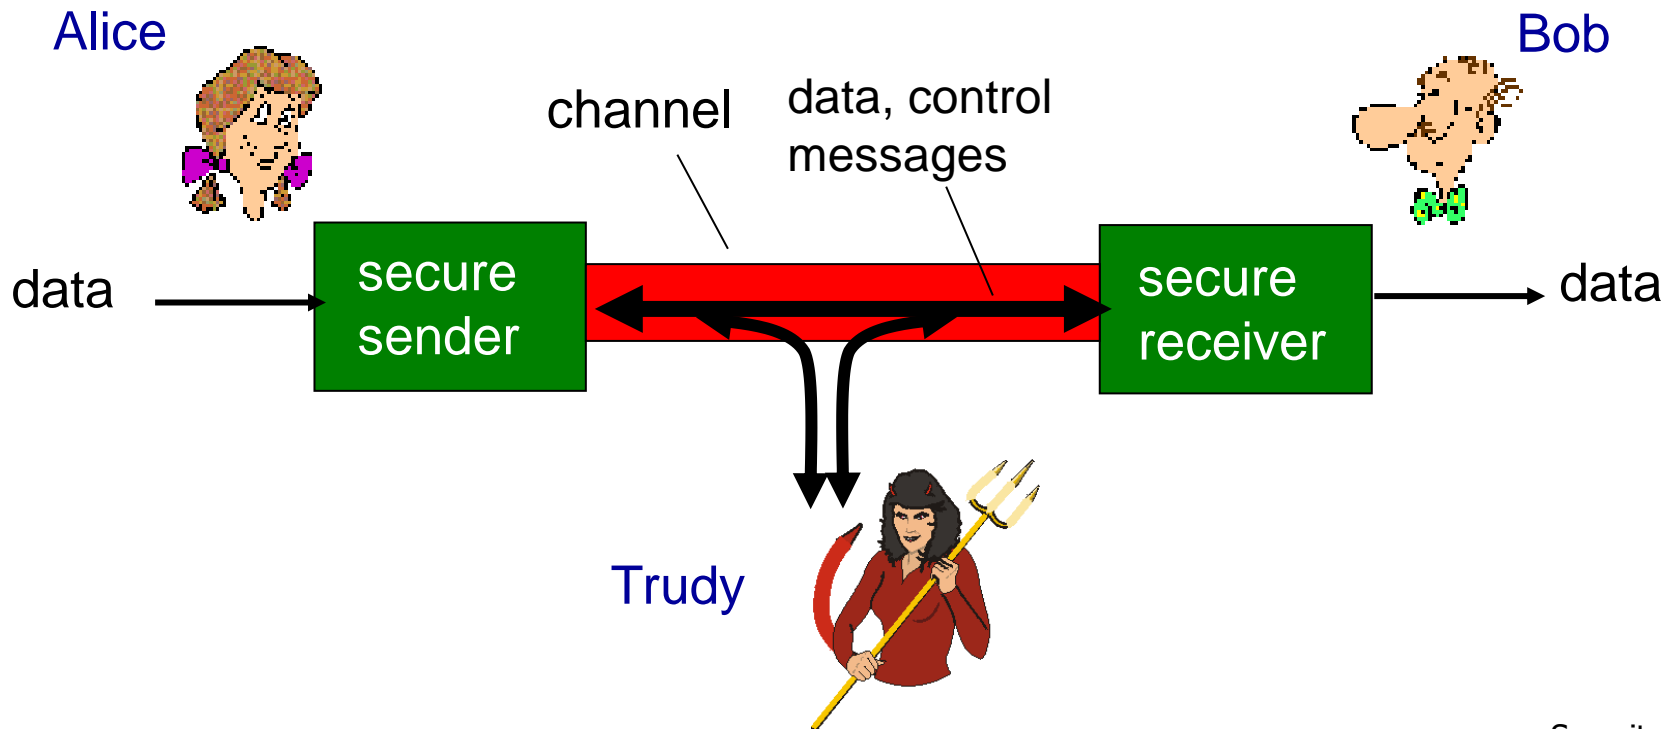

*authentication*: sender, receiver want to confirm identity of  
each other

*message integrity*: sender, receiver want to ensure message  
not altered (in transit, or afterwards) without detection

*access and availability*: services must be accessible and  
available to users

# Friends and enemies: Alice, Bob, Trudy

- Bob, Alice want to communicate “securely”
- Trudy (intruder) may intercept, delete, or add messages

# Who might Bob, Alice be?

- Web browser/server for electronic transactions (e.g., on-line purchases)
- on-line banking client/server
- DNS clients/servers
- routers exchanging routing table updates
- other examples?

# There are bad guys out there!

Q: What can a “bad guy” do?

A: A lot! See section 1.6

- *eavesdropping*: intercept messages
- *injection*: insert messages into connection
- *impersonation*: can fake (spoof) source address in packet (or any field in packet)
- *hijacking*: “take over” ongoing connection by removing sender or receiver, inserting himself in place
- *denial of service*: prevent service from being used by others (e.g., by overloading resources)

# Chapter 8 roadmap

8.1 What is network security?

8.2 *Principles of cryptography*

8.3 Message integrity, authentication

8.4 Securing e-mail

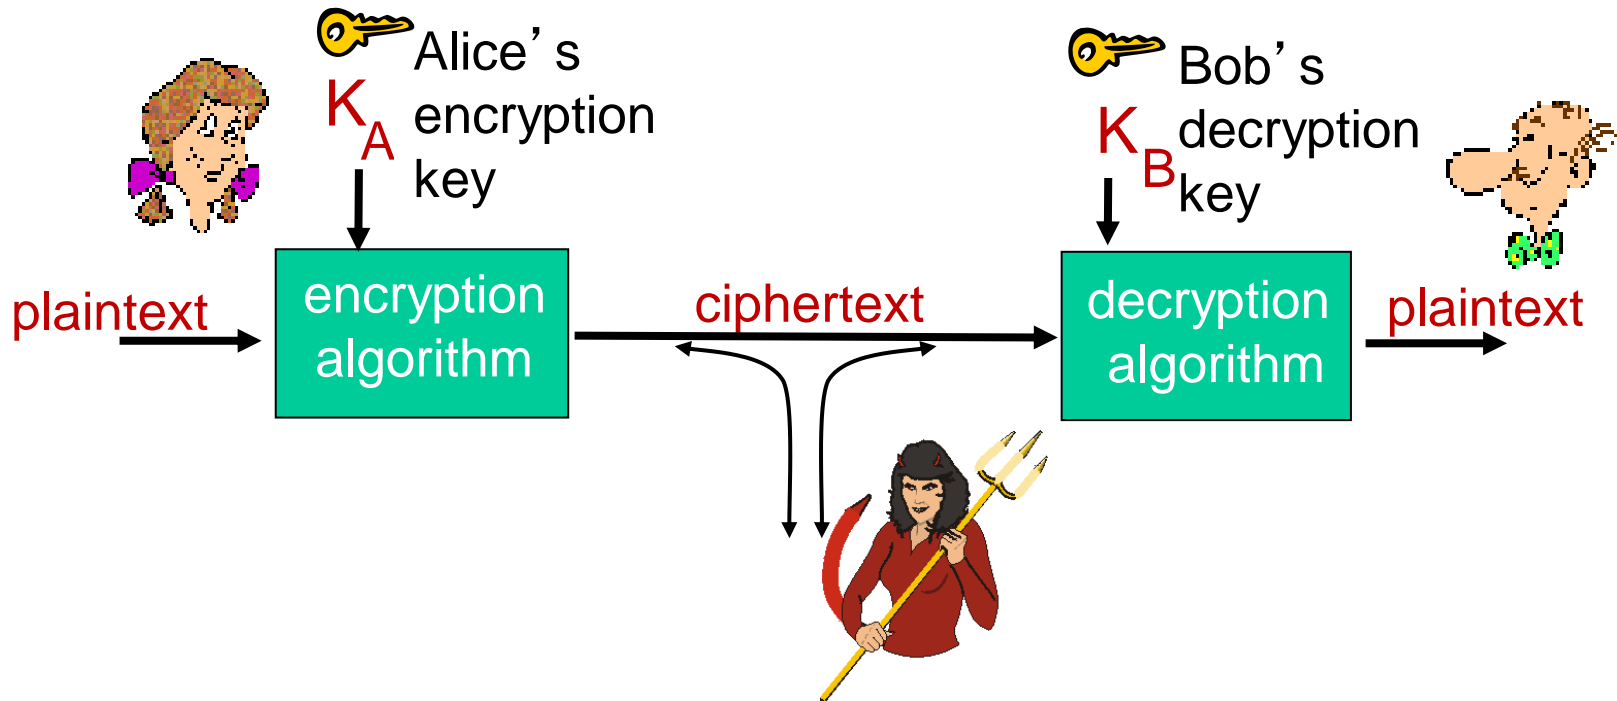

8.5 Securing TCP connections: SSL

8.6 Network layer security: IPsec

8.7 Securing wireless LANs

8.8 Operational security: firewalls and IDS

# The language of cryptography

$m$  plaintext message

$K_A(m)$  ciphertext, encrypted with key  $K_A$

$m = K_B(K_A(m))$

# Breaking an encryption scheme

- **cipher-text only attack:** Trudy has ciphertext she can analyze
- **two approaches:**
  - brute force: search through all keys

Key Size (bits)	Number of Alternative Keys	Time required at 1 decryption/ $\mu$ s	Time required at $10^6$ decryptions/ $\mu$ s
32	$2^{32} = 4.3 \times 10^9$	$2^{31} \mu\text{s} = 35.8 \text{ minutes}$	2.15 milliseconds
56	$2^{56} = 7.2 \times 10^{16}$	$2^{55} \mu\text{s} = 1142 \text{ years}$	10.01 hours
128	$2^{128} = 3.4 \times 10^{38}$	$2^{127} \mu\text{s} = 5.4 \times 10^{24} \text{ years}$	$5.4 \times 10^{18} \text{ years}$
168	$2^{168} = 3.7 \times 10^{50}$	$2^{167} \mu\text{s} = 5.9 \times 10^{36} \text{ years}$	$5.9 \times 10^{30} \text{ years}$
26 characters (permutation)	$26! = 4 \times 10^{26}$	$4 \times 10^{26} \mu\text{s} = 6.4 \times 10^{12} \text{ years}$	$6.4 \times 10^6 \text{ years}$

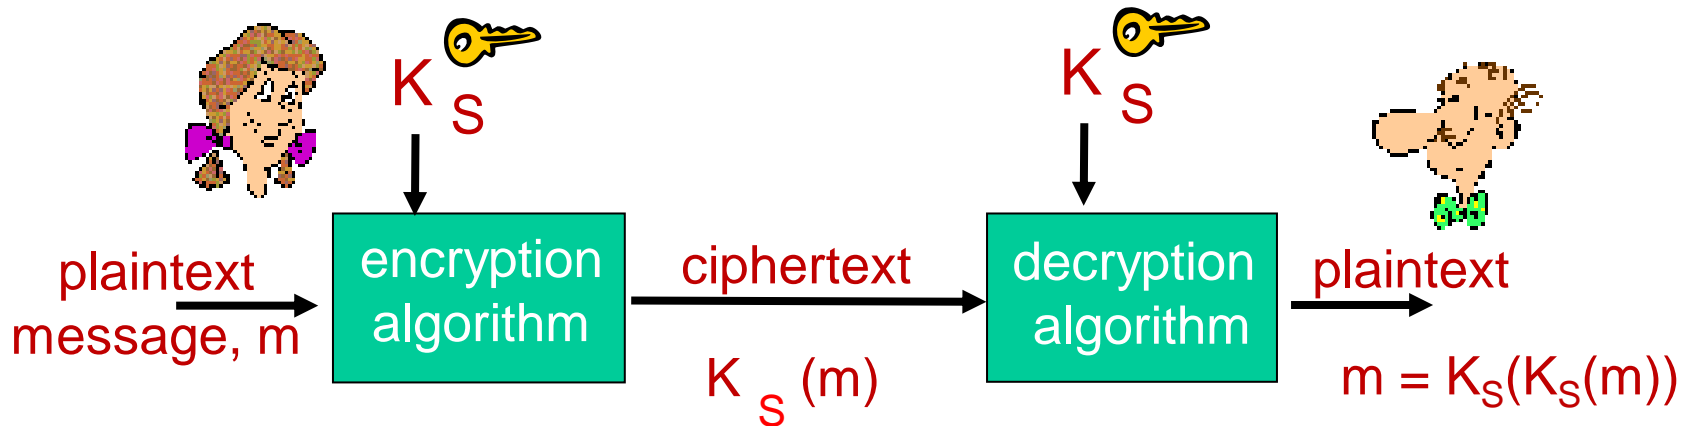

- statistical analysis

# Breaking an encryption scheme

- **known-plaintext attack:** Trudy has plaintext corresponding to ciphertext
  - e.g., in monoalphabetic cipher, Trudy determines pairings for a,l,i,c,e,b,o,
- **chosen-plaintext attack:** Trudy can get ciphertext for chosen plaintext

# Symmetric key cryptography

**symmetric key crypto:** Bob and Alice share same (symmetric) key:  $K_S$

- e.g., key is knowing substitution pattern in mono alphabetic substitution cipher

Q: how do Bob and Alice agree on key value?

A: Initial key distribution

# Caesar Cipher

- can define transformation as:

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z
D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z	A	B	C

- mathematically give each letter a number

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25

- then have Caesar cipher as:

$$c = E(p) = (p + k) \bmod (26)$$

$$p = D(c) = (c - k) \bmod (26)$$

# Cryptanalysis of Caesar Cipher

- only have 26 possible ciphers
  - A maps to A,B,..Z
- could simply try each in turn
- a brute force search
- given ciphertext, just try all shifts of letters
- do need to recognize when have plaintext
- E.g. break ciphertext “GCUA VQ DTGCM”

# Simple encryption scheme

*substitution cipher*: substituting one thing for another

- monoalphabetic cipher: substitute one letter for another

plaintext:	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
		↓																								↓
ciphertext:	m	n	b	v	c	x	z	a	s	d	f	g	h	j	k	l	p	o	i	u	y	t	r	e	w	q

e.g.: Plaintext: bob. i love you. alice  
ciphertext: nkn. s gktc wky. mgsbc

 *Encryption key*: mapping from set of 26 letters  
to set of 26 letters

*# of keys*:  $26! = 4 \times 10^{26}$

# Language Redundancy and Cryptanalysis

- letters are not equally commonly used
- in English E is by far the most common letter
  - followed by T,R,N,I,O,A,S
- other letters like Z, J, K, Q, X are fairly rare
- have tables of single, double & triple letter frequencies for various languages

# English Letter Frequencies

# Use in Cryptanalysis

- key concept - monoalphabetic substitution ciphers do not change relative letter frequencies
- calculate letter frequencies for ciphertext
- compare counts/plots against known values
- look for common peaks/troughs
  - peaks at: A-E-I triple, NO pair, RST triple
  - troughs at: JK, X-Z

# A more sophisticated encryption approach

- n substitution ciphers,  $M_1, M_2, \dots, M_n$
- cycling pattern:
  - e.g.,  $n=4$ :  $M_1, M_3, M_4, M_3, M_2$ ;  $M_1, M_3, M_4, M_3, M_2$ ; ..
- for each new plaintext symbol, use subsequent substitution pattern in cyclic pattern
  - dog: d from  $M_1$ , o from  $M_3$ , g from  $M_4$

*Encryption key:* n substitution ciphers, and cyclic pattern

- key need not be just n-bit pattern

# Transposition Ciphers

- now consider classical **transposition** or **permutation** ciphers
- these hide the message by rearranging the letter order, without altering the actual letters used
- can recognise these since have the same frequency distribution as the original text

- E.g. rail fence cipher, write message out as:

```
m e m a t r h t g p r y  
e t e f e t e o a a t
```

- giving ciphertext

```
MEMATRHTGPRYETEFETEOAAT
```

# Product Ciphers

- ciphers using only substitutions or transpositions are not secure because of language characteristics
- hence consider using several ciphers in succession to make harder
- this is bridge from classical to modern ciphers

# DES: Data Encryption Standard

- widely used symmetric key cipher
- US encryption standard [NIST 1993]
- 56-bit symmetric key, 64-bit plaintext input
- pros:
  - product cipher
  - block cipher with cipher block chaining
  - no known good analytic attack
- cons:
  - DES Challenge: 56-bit-key-encrypted phrase decrypted (brute force) in less than a day
  - inflexible

# AES: Advanced Encryption Standard

- symmetric-key NIST standard, replacing DES (Nov 2001)
- processes data in 128 bit blocks
- flexible key length: 128, 192, or 256 bits
- brute force decryption (try each key) taking 1 sec on DES, takes 149 trillion years for AES

# Public Key Cryptography

## *symmetric key crypto*

- requires sender, receiver know shared secret key
- Q: how to agree on key in first place (particularly if never “met”)?

## *public key crypto*

- radically different approach [Diffie-Hellman76, RSA78]
- sender, receiver do *not* share secret key
- *public* encryption key known to *all*
- *private* decryption key known only to receiver

# Public Key Example

The screenshot shows a web browser window with the Bank of America website. The address bar displays <https://www.bankofamerica.com>. The navigation menu includes **Personal**, **Small Business**, **Wealth Management**, and **Businesses & Ins**. A **Certificate** dialog box is open, showing the **General** tab. The **Show:** dropdown is set to **<All>**. The certificate details are as follows:

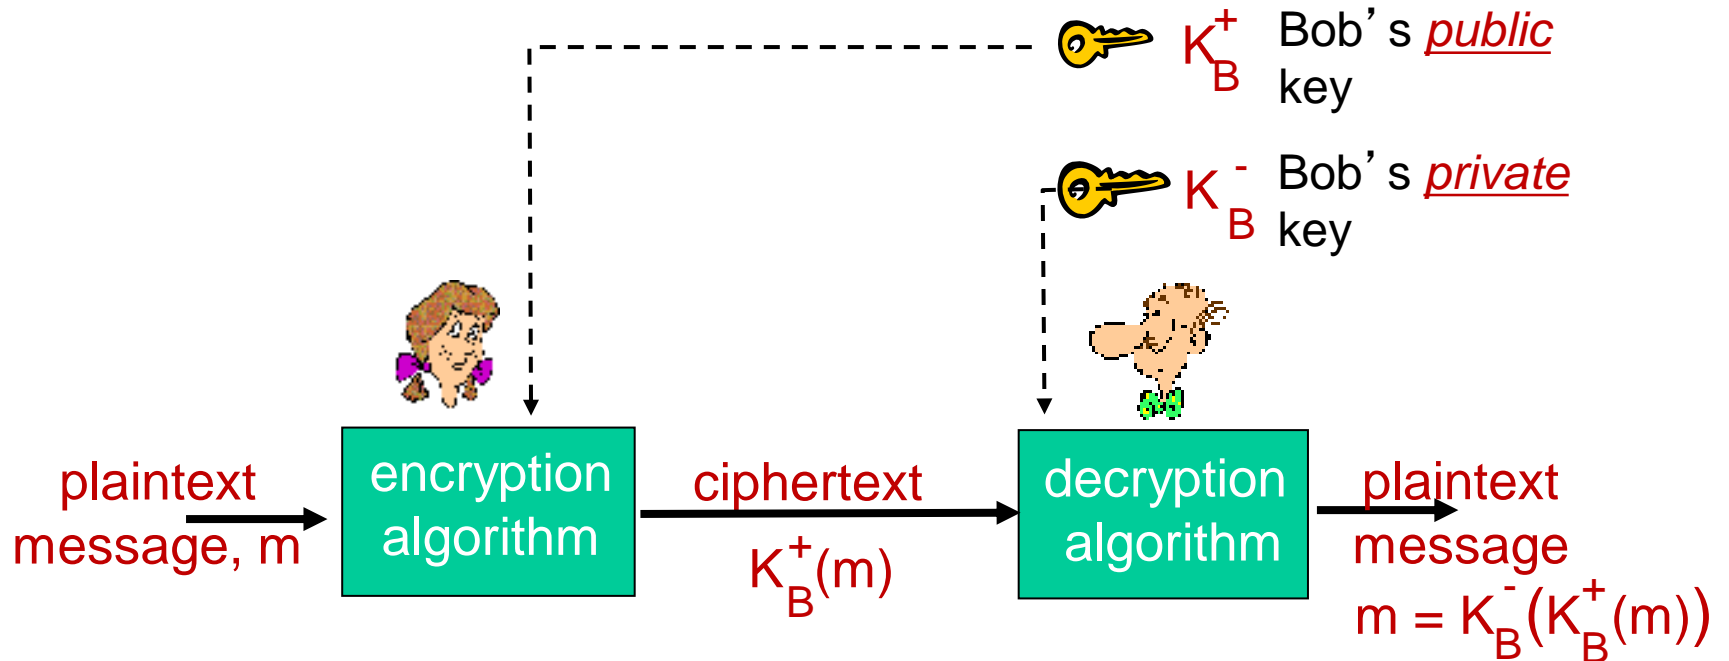

Field	Value
Issuer	Entrust Certification Authority - L1M, (c) 2014 E
Valid from	Friday, February 21, 2020 1:26:23 PM
Valid to	Sunday, February 21, 2021 1:56:21 PM
Subject	www.bankofamerica.com, 2927442, eComm Ne
Public key	RSA (2048 Bits)
Public key param...	05 00
Subject Alternativ...	DNS Name=www.bankofamerica.com, DNS Nar
SCT List	v1 5581d4c2160036014a0b0b573c53f0e4

The **Public key** field is highlighted. Below the table, the raw public key data is displayed in hexadecimal format:

```
30 82 01 0a 02 82 01 01 00 b1 d9 dd 66 29 19 68 72 cd a6
31 44 6a ac 8b e5 ea fe 4b 47 84 a5 a5 f8 8c 6a 05 5f f6

cf 87 4c b3 89 1c a4 a0 f4 65 8a 2d 52 92 a9 7a be f1 fe
de 4a 6b 1f a2 cf af 00 f4 4b 43 c5 a5 d7 4b 09 49 8a 58
```

At the bottom of the dialog, there are buttons for **Edit Properties...** and **Copy to File...**.

# Public key cryptography

# Public key encryption algorithms

requirements:

- ① need  $K_B^+(\cdot)$  and  $K_B^-(\cdot)$  such that

$$K_B^-(K_B^+(m)) = m$$

- ② given public key  $K_B^+$ , it should be impossible to compute private key  $K_B^-$

**RSA:** Rivest, Shamir, Adelson algorithm

# RSA: another important property

The following property will be *very* useful later:

$$\underbrace{K_B^-(K_B^+(m))}_{\text{use public key first, followed by private key}} = m = \underbrace{K_B^+(K_B^-(m))}_{\text{use private key first, followed by public key}}$$

use public key first,  
followed by  
private key

use private key  
first, followed by  
public key

*result is the same!*

# RSA in practice: session keys

- exponentiation in RSA is computationally intensive
- DES is at least 100 times faster than RSA
- use public key crypto to establish secure connection, then establish second key – symmetric session key – for encrypting data

## *session key, $K_S$*

- Bob and Alice use RSA to exchange a symmetric key  $K_S$
- once both have  $K_S$ , they use symmetric key cryptography

# Chapter 8 roadmap

- 8.1 What is network security?
- 8.2 Principles of cryptography
- 8.3 Message integrity, *authentication*
- 8.4 Securing e-mail
- 8.5 Securing TCP connections: SSL
- 8.6 Network layer security: IPsec
- 8.7 Securing wireless LANs
- 8.8 Operational security: firewalls and IDS

# Authentication

*Goal:* Bob wants Alice to “prove” her identity to him

*Protocol ap1.0:* Alice says “I am Alice”

Failure scenario??

# Authentication

*Goal:* Bob wants Alice to “prove” her identity to him

*Protocol ap1.0:* Alice says “I am Alice”

“I am Alice”

in a network,  
Bob can not “see” Alice,  
so Trudy simply declares  
herself to be Alice

# Authentication: another try

*Protocol ap2.0:* Alice says “I am Alice” in an IP packet containing her source IP address

# Authentication: another try

*Protocol ap2.0:* Alice says “I am Alice” in an IP packet containing her source IP address

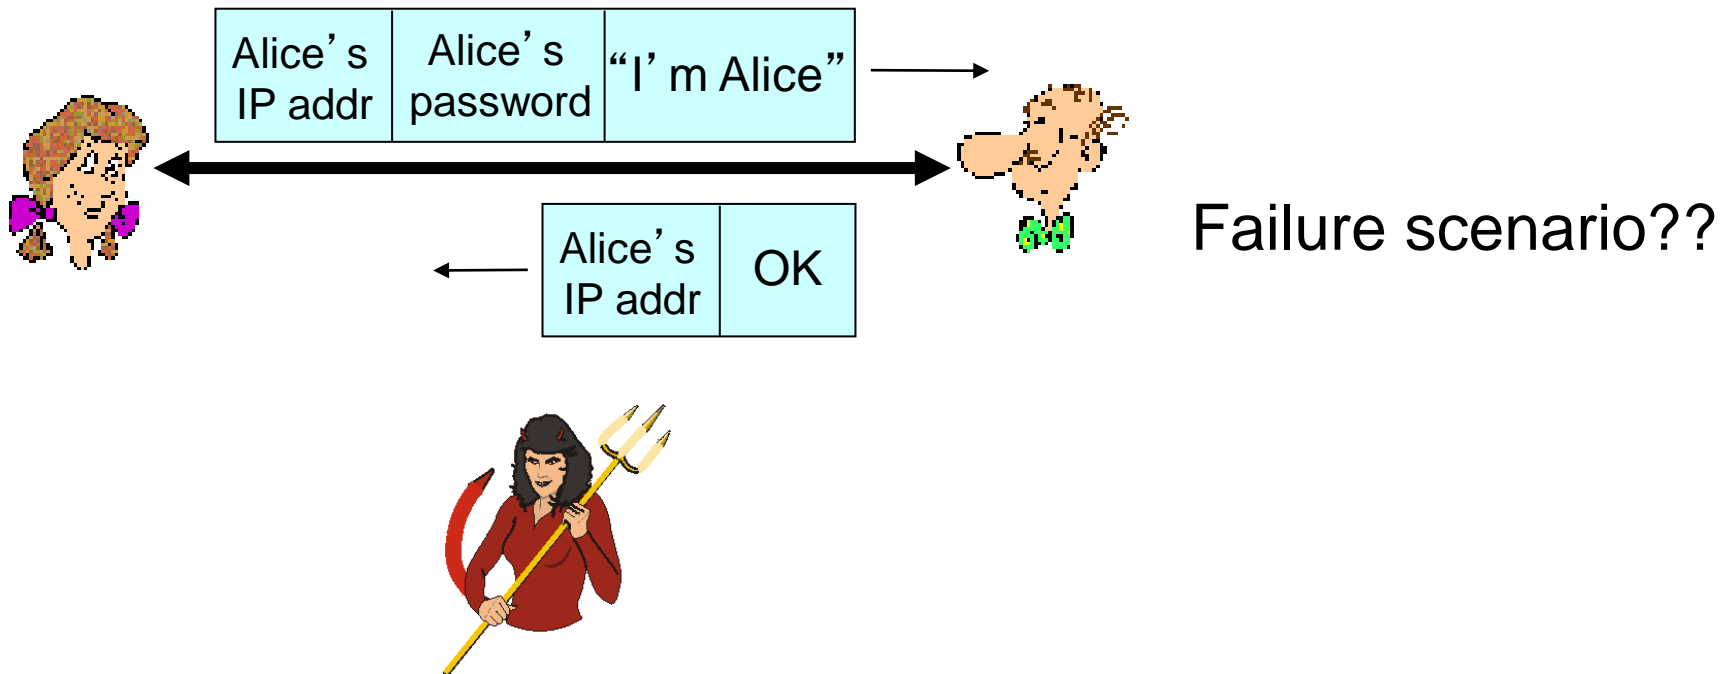

Trudy can create a packet  
“spoofing”  
Alice's address

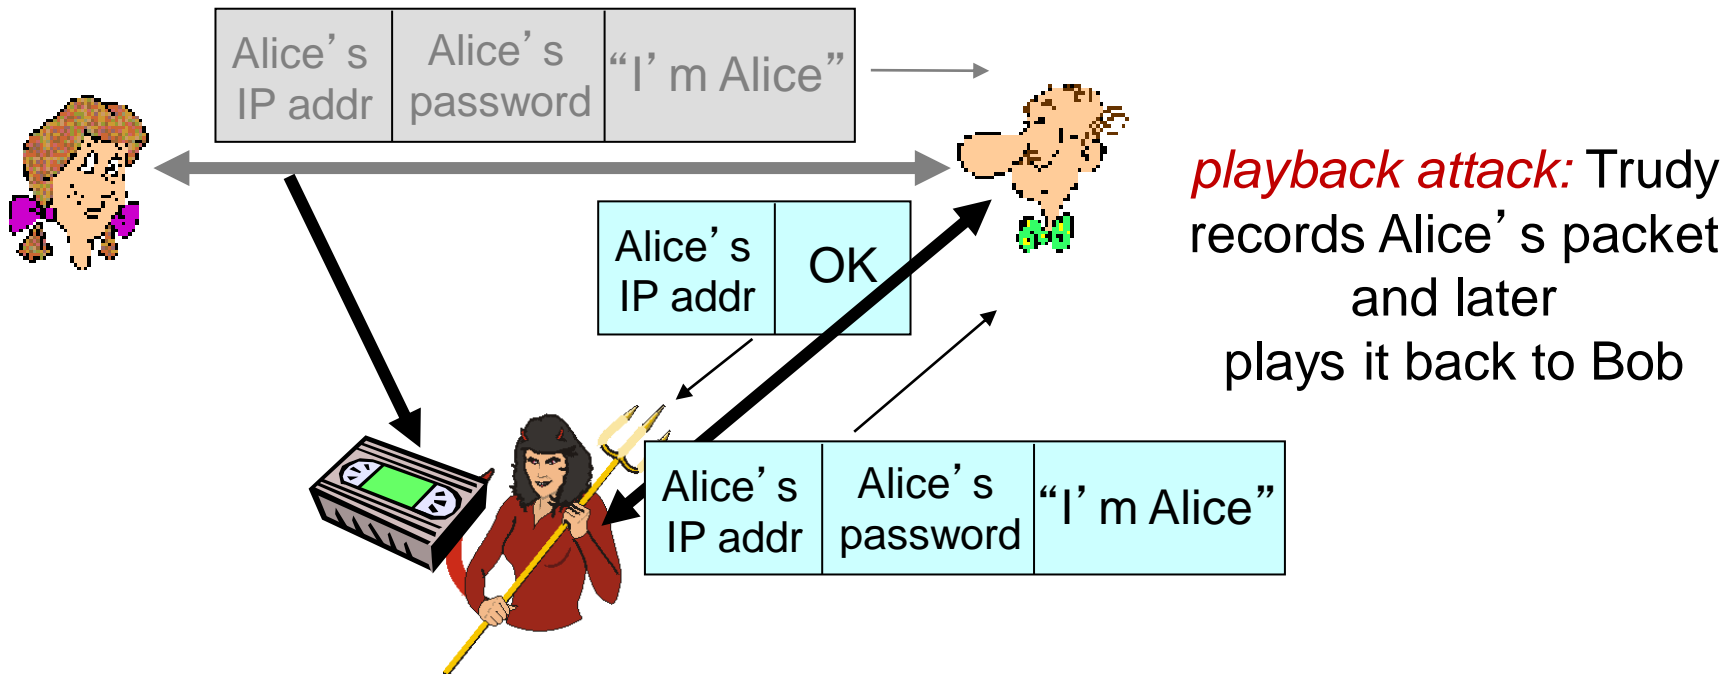

# Authentication: another try

*Protocol ap3.0:* Alice says “I am Alice” and sends her secret password to “prove” it.

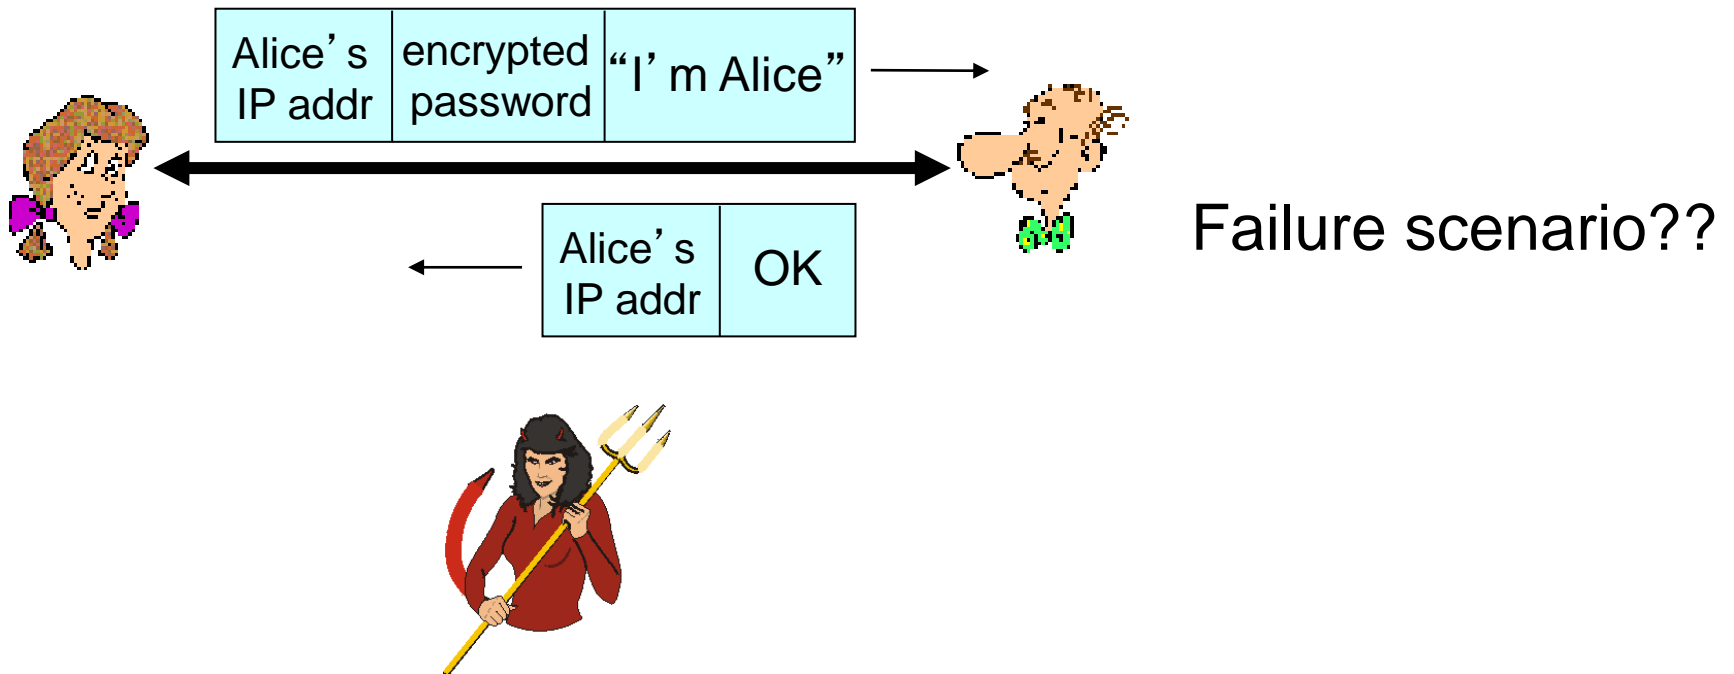

# Authentication: another try

*Protocol ap3.0:* Alice says “I am Alice” and sends her secret password to “prove” it.

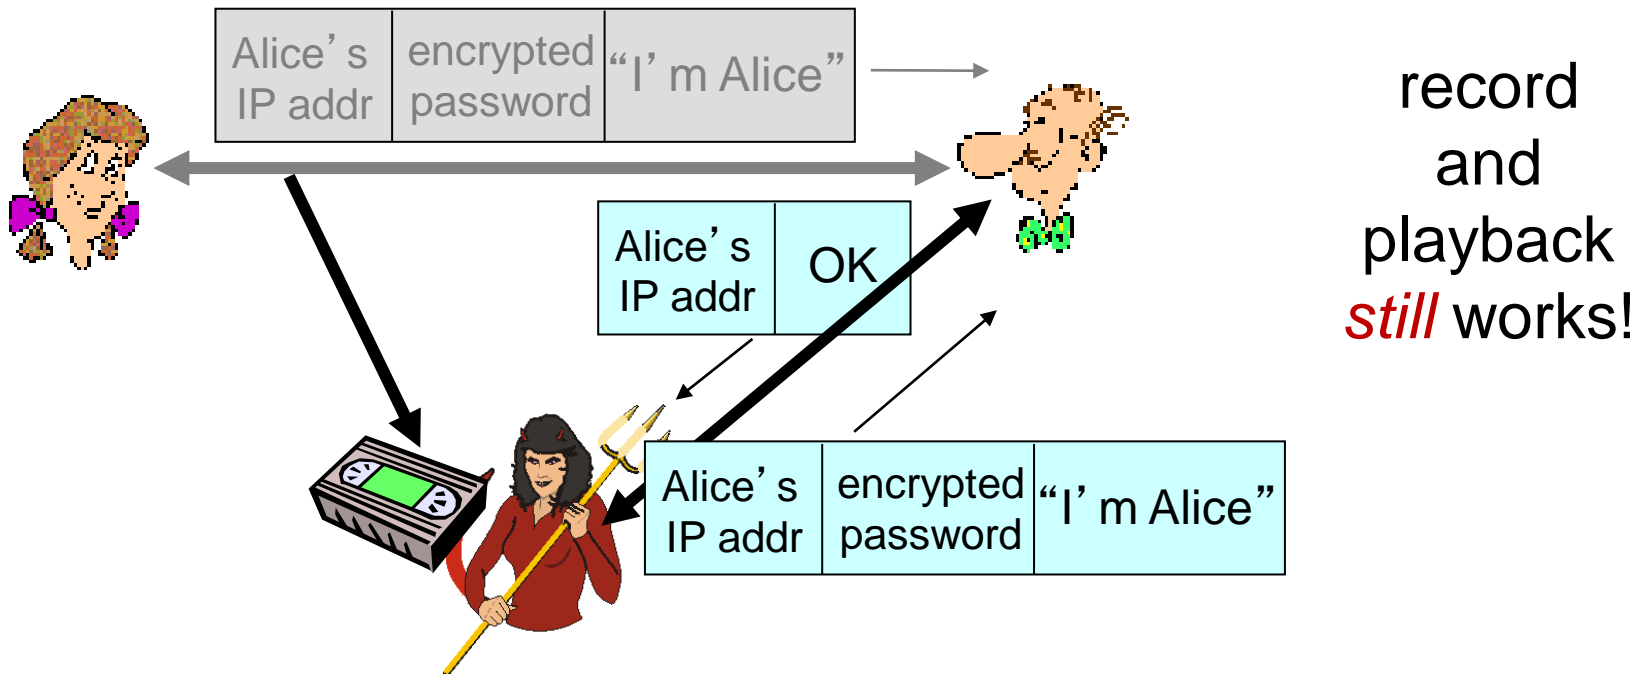

# Authentication: yet another try

*Protocol ap3.1:* Alice says “I am Alice” and sends her *encrypted* secret password to “prove” it.

# Authentication: yet another try

*Protocol ap3.1:* Alice says “I am Alice” and sends her *encrypted* secret password to “prove” it.

# Authentication: yet another try

**Goal:** avoid playback attack

**nonce:** number (R) used only *once-in-a-lifetime*

**ap4.0:** to prove Alice “live”, Bob sends Alice **nonce**, R. Alice must return R, encrypted with shared secret key

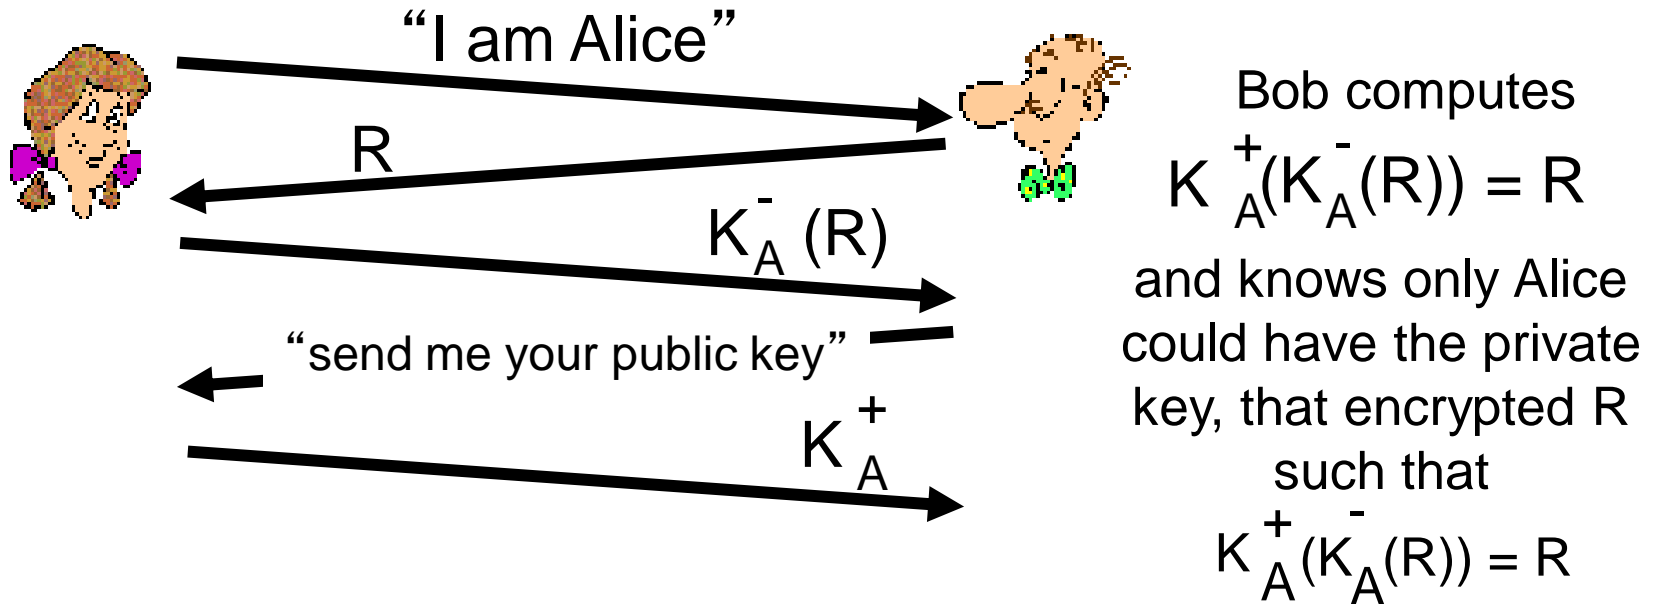

Failures, drawbacks?

# Authentication: ap5.0

ap4.0 requires shared symmetric key

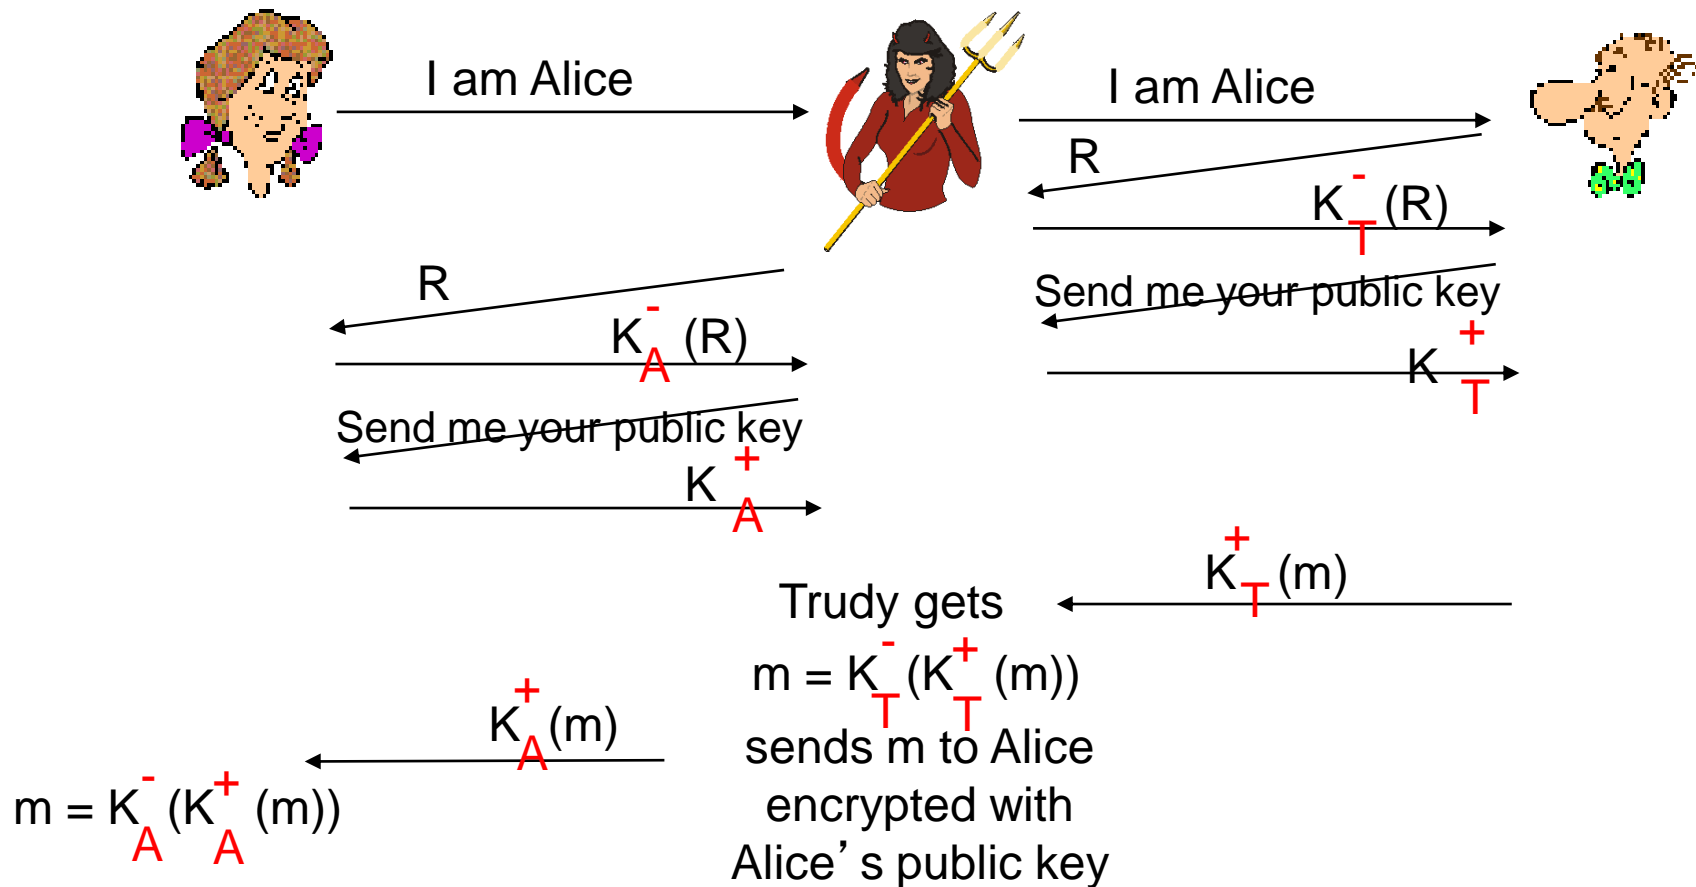

- can we authenticate using public key techniques?

*ap5.0*: use nonce, public key cryptography

# ap5.0: security hole

*man in the middle attack:* Trudy poses as Alice (to Bob) and as Bob (to Alice)

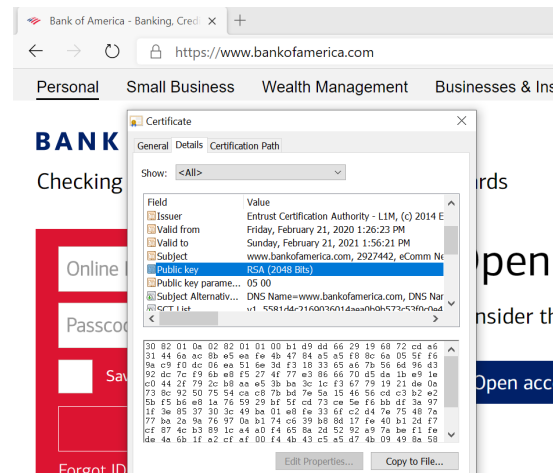

# ap5.0: security hole

*man in the middle attack:* Trudy poses as Alice (to Bob) and as Bob (to Alice)

use digital certificate to assure identity  
e.g. BoA's certificate proving website authenticity

# Chapter 8 roadmap

- 8.1 What is network security?
- 8.2 Principles of cryptography
- 8.3 *Message integrity*, authentication
- 8.4 Securing e-mail
- 8.5 Securing TCP connections: SSL
- 8.6 Network layer security: IPsec
- 8.7 Securing wireless LANs
- 8.8 Operational security: firewalls and IDS

# Digital signatures

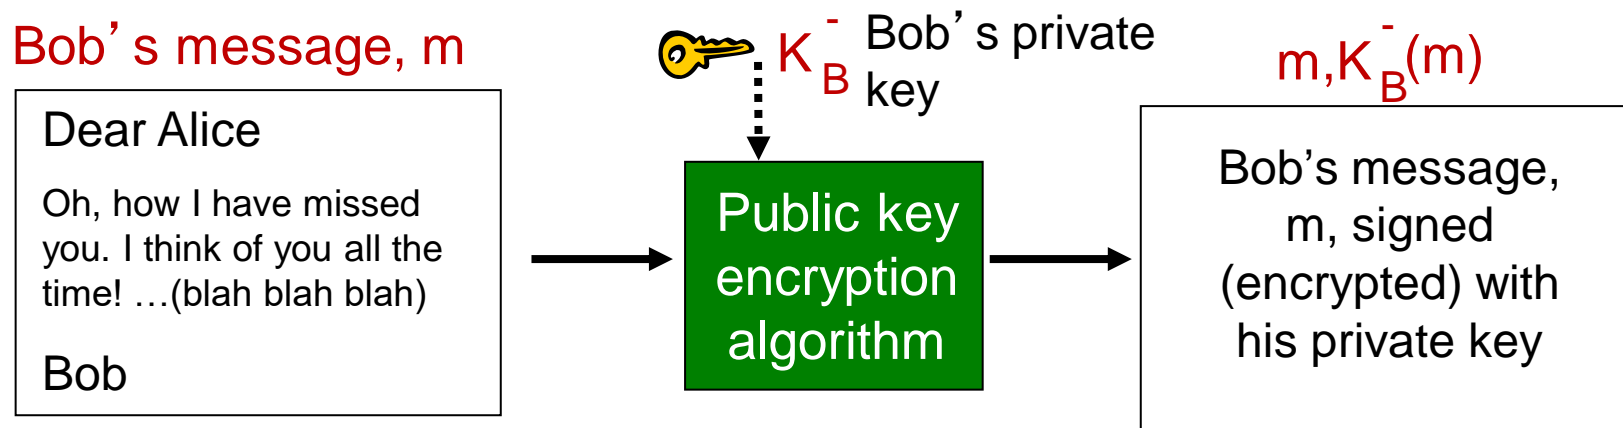

cryptographic technique analogous to hand-written signatures:

- sender (Bob) digitally signs document, establishing he is document owner/creator.
- *verifiable, nonforgeable*: recipient (Alice) can prove to someone that Bob, and no one else (including Alice), must have signed document

# Digital signatures

simple digital signature for message  $m$ :

- Bob signs  $m$  by encrypting with his private key  $K_B^-$ , creating “signed” message,  $K_B^-(m)$

# Digital signatures

- suppose Alice receives msg  $m$ , with signature:  $m, K_B^-(m)$
- Alice verifies  $m$  signed by Bob by applying Bob's public key  $K_B^+$  to  $K_B^-(m)$  then checks  $K_B(K_B^+(m)^- ) = m$ .
- If  $K_B^+(K_B^-(m) ) = m$ , whoever signed  $m$  must have used Bob's private key.

Alice thus verifies that:

- Bob signed  $m$
- no one else signed  $m$
- Bob signed  $m$  and not  $m'$

non-repudiation:

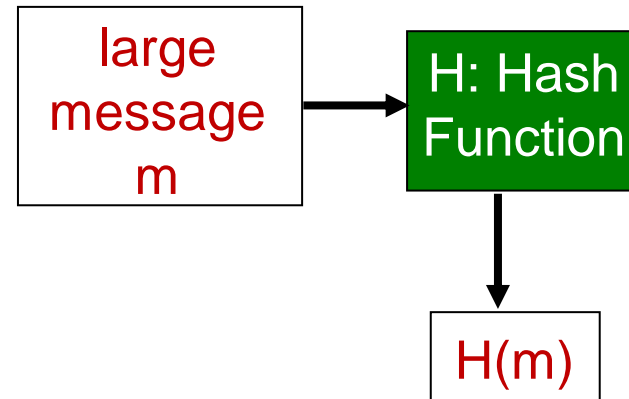

- Alice can take  $m$ , and signature  $K_B^-(m)$  to court and prove that Bob signed  $m$

# Message digests

computationally  
expensive to public-key-  
encrypt long messages

**goal:** fixed-length, easy-  
to-compute digital  
“fingerprint”

- apply hash function  $H$  to  $m$ , get fixed size message digest,  $H(m)$ .

Thank you for downloading  
Ubuntu Desktop

Your download should start automatically. If it doesn't, [download now](#).

You can [verify your download](#) or get [help on installing](#).

Run this command in your terminal in the directory the iso was downloaded to  
verify the SHA256 checksum:

```
echo  
"b45165ed3cd437b9ffad02a2aad22a4ddc69162470e2622982889ce5826f  
6e3d *ubuntu-20.04.1-desktop-amd64.iso" | shasum -a 256  
--check
```

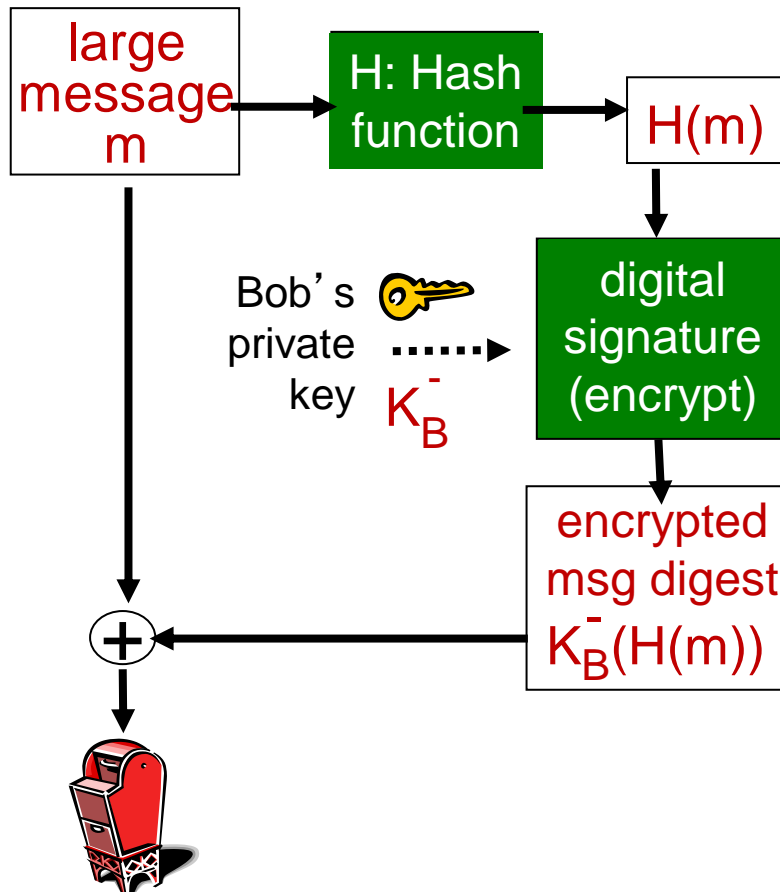

You should get the following output:

```
ubuntu-20.04.1-desktop-amd64.iso: OK
```

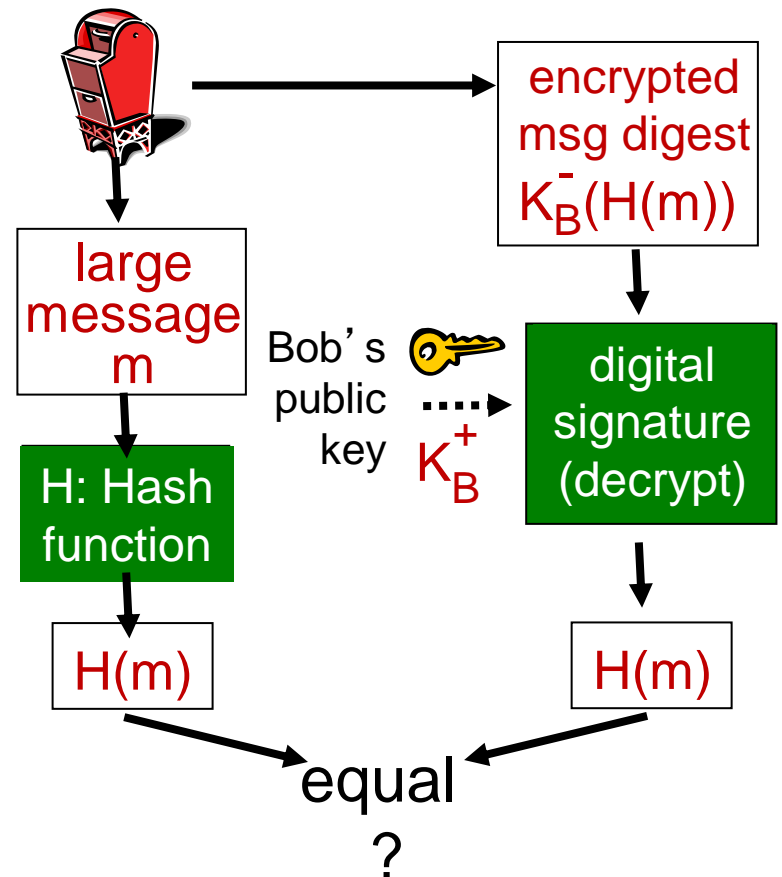

Or follow this tutorial to learn [how to verify downloads](#)

# Digital signature = signed message digest

Bob sends digitally signed message:

Alice verifies signature, integrity of digitally signed message:

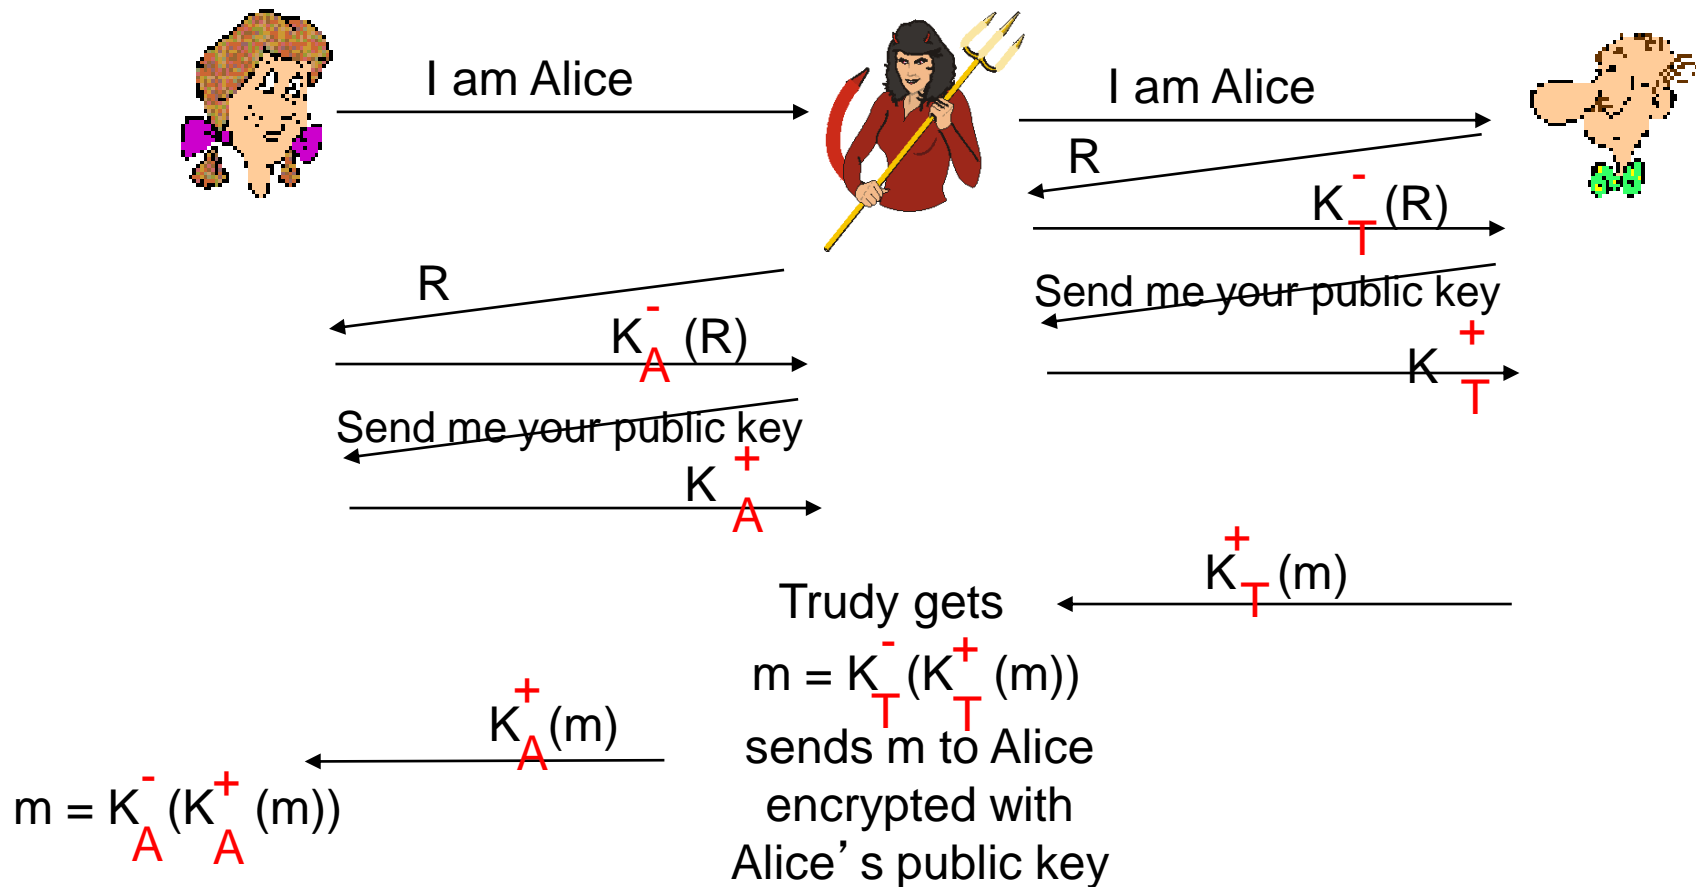

# Hash function algorithms

- **MD5 hash function widely used (RFC 1321)**
  - computes 128-bit message digest in 4-step process.
  - arbitrary 128-bit string  $x$ , appears difficult to construct msg  $m$  whose MD5 hash is equal to  $x$
- **SHA-1 is also used**
  - US standard [NIST, FIPS PUB 180-1]
  - 160-bit message digest

# Recall: ap5.0 security hole

*man in the middle attack:* Trudy poses as Alice (to Bob) and as Bob (to Alice)

# Certification authorities

- **certification authority (CA):** binds public key to particular entity, E.
- E (person, router) registers its public key with CA.
  - E provides “proof of identity” to CA.
  - CA creates certificate binding E to its public key.
  - certificate containing E’s public key digitally signed by CA – CA says “this is E’s public key”

# Certification authorities

- when Alice wants Bob's public key:
  - gets Bob's certificate (Bob or elsewhere).
  - apply CA's public key to Bob's certificate, get Bob's public key
